

Euphonix Technical Bulletin 0603-1

DX202E & DX202EE Exabyte Back Up Chassis is Discontinued / Back Up Technology Recommendation

Systems Affected: S5 Max Air R1 X

Unit's Affected: R-1

Problem: Exabyte has discontinued the Mammoth tape drives.

Procedure: We expect the media to be in the market for some time but plan to upgrade to a Transfer Station at your earliest convenience. See additional notes below.

Recommendation: The Euphonix TransferStation was designed anticipating this development. With dual 200 GB internal drives the TransferStation can handle considerable content from your R-1 AD801 Audio Deck drives. The TransferStation utilizes standard protocols to move this data to your choice of format-centralized servers or archival drives or tape. All popular formats are supported with our favorite being DLT tape with 80 GB, or the newer LTO standard, which currently supports 200 GB with plans to support 400 GB.
